## Figures

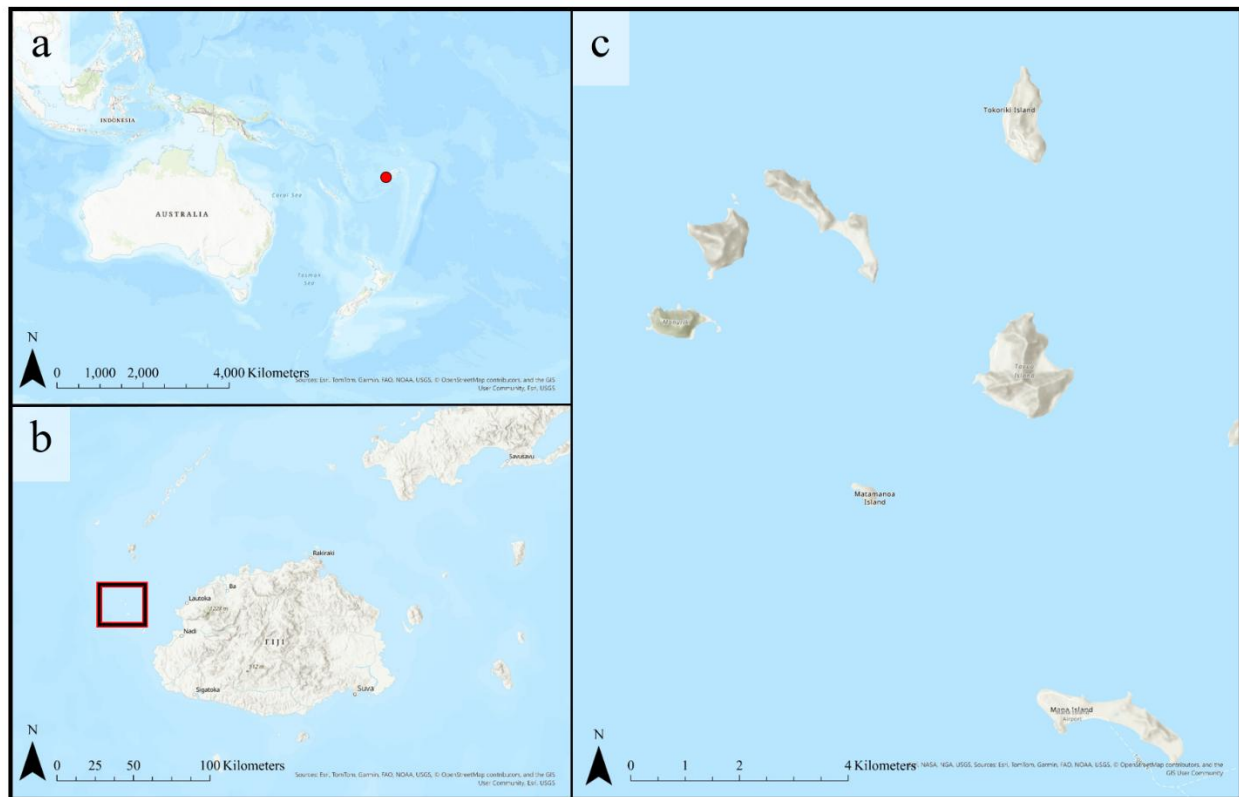

Figure 1. (a) Map of Pacific Ocean/Oceania region with Fiji within black box. (b) The Mamanuca Islands, within the red and black box, are off the west coast of Viti Levu. (c) The most common filming locations within the Mamanuca Islands, at approximately 17.673° S , 177.107° E.

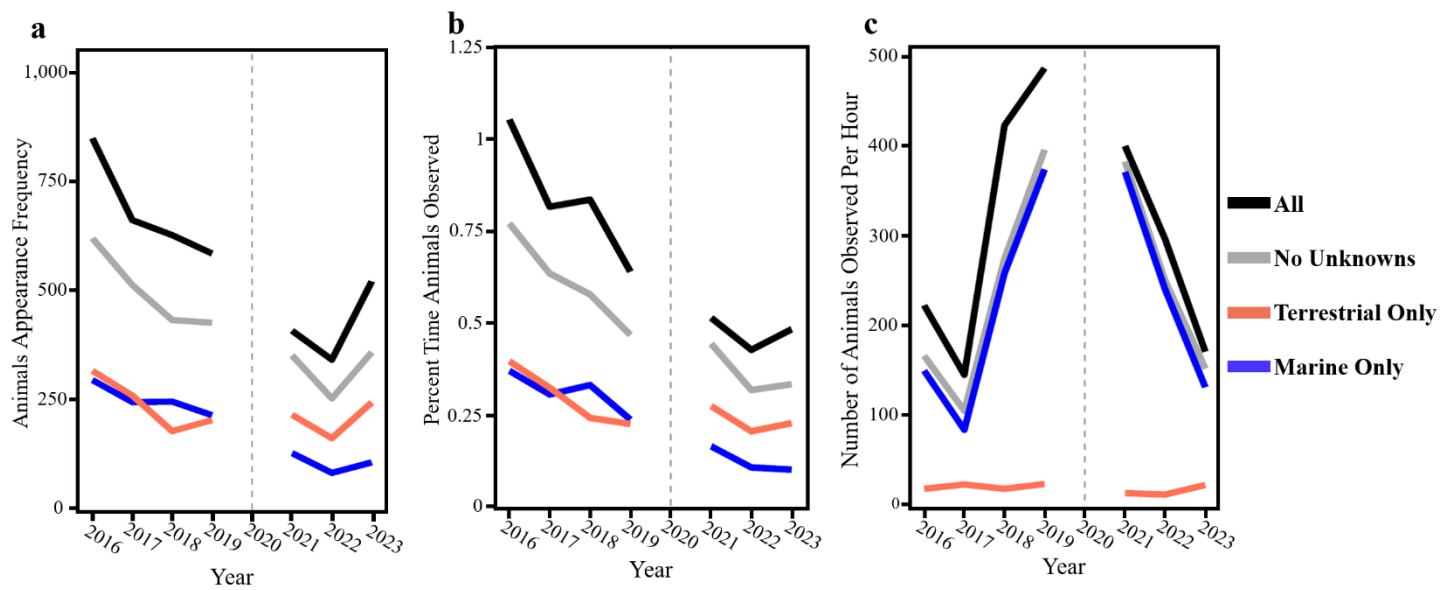

Figure 2. (a) The frequency in which animals appeared on the screen for both seasons filmed within the same year. This is count of appearances, not the abundance of the animals on the screen. (b) The percentage of screen time animals were observed for both seasons in the same year. (c) The mean number of animals observed per one hour of screen time. Please note the omission of 2020 in the figures. This was done to not obscure the trends in the way they were viewed.

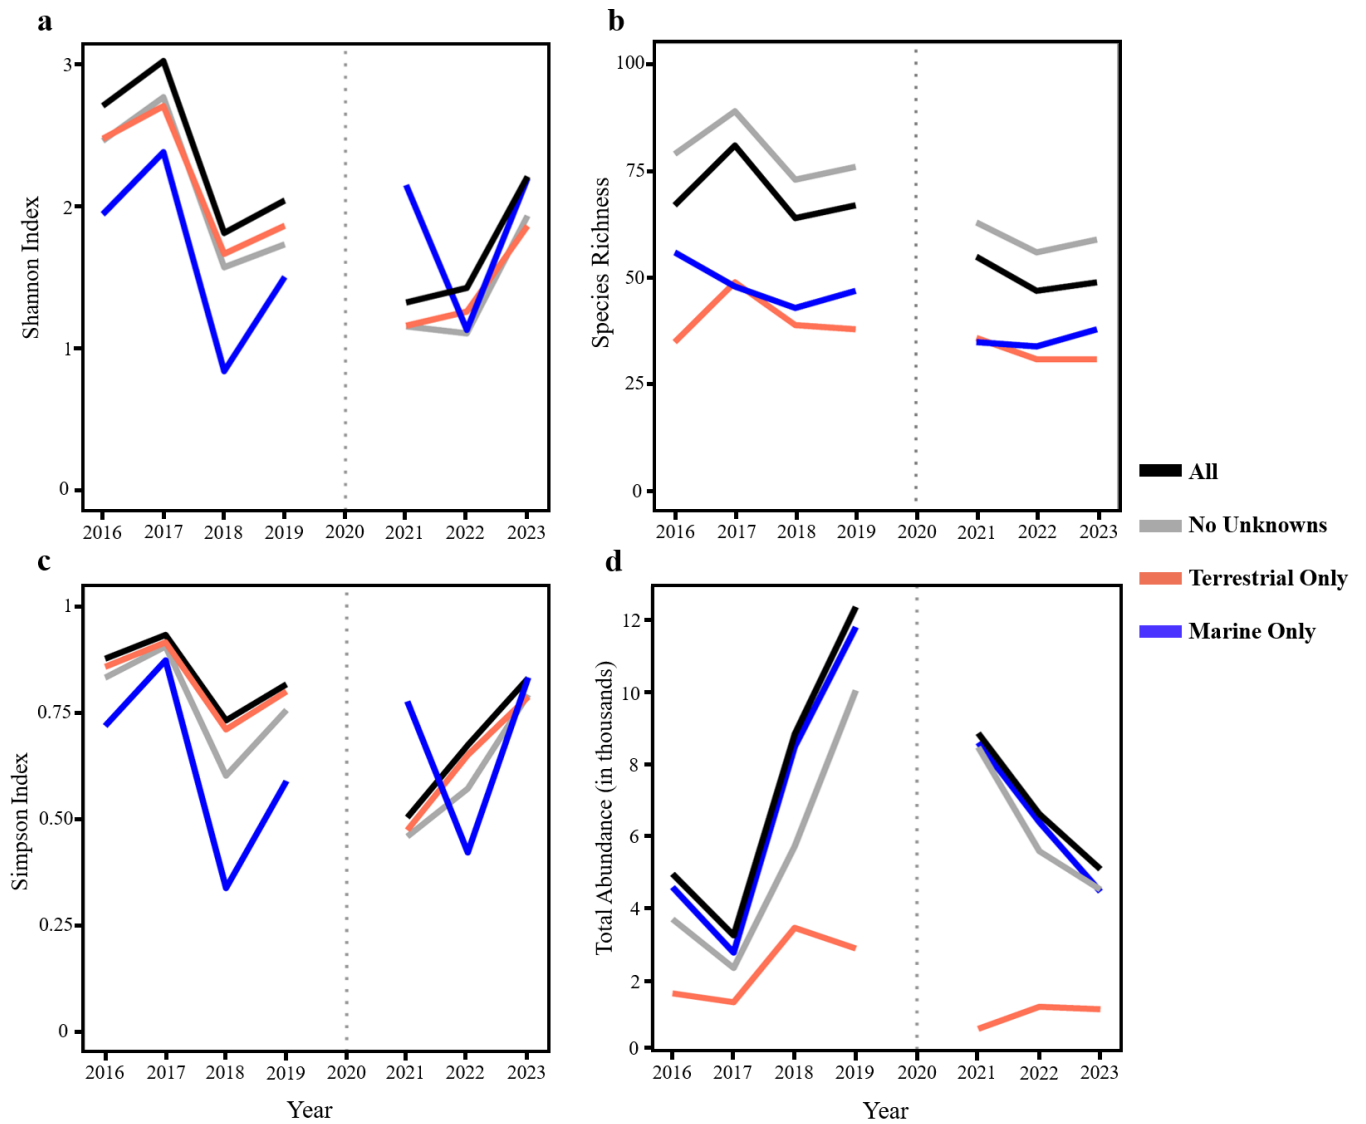

Figure 3. (a) Shannon index, (b) species richness, (c) Simpson diversity index, and (d) total abundance for all animals, all but unknown animals, terrestrial animals only, and marine animals only. Grouping these separately provides insight into variation in these metrics based on the environment and identification of these animals. Please note the omission of 2020 in the figures.

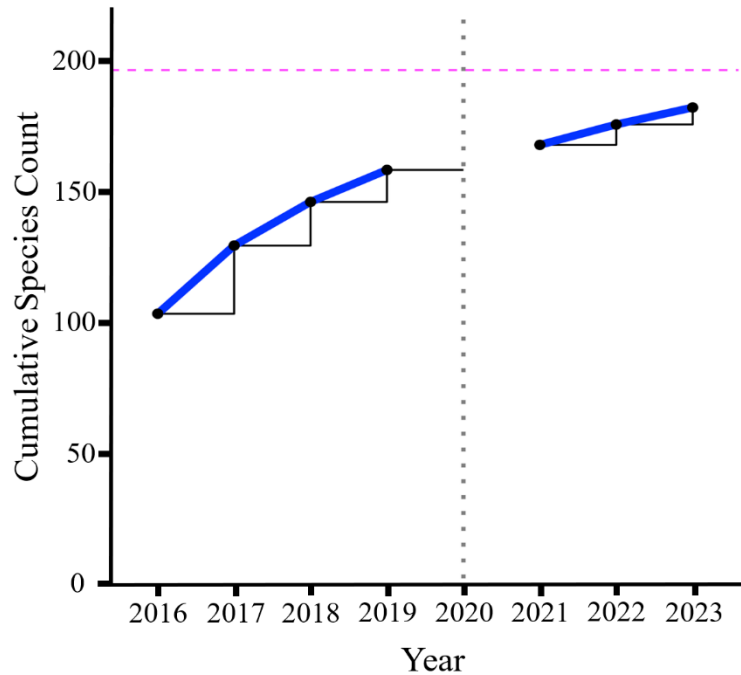

Figure 4. Accumulation curve for cumulative taxa counts for each year of filming for those that could be identified down to the family, genus, or species level. Black line is cumulative taxon count displayed stepwise while the blue line is linear connecting each point by year. The pink line represents the theoretical asymptote of the estimated maximum number of unique taxa from this data source ( $n = 198$ ) if editing and footage collection methods continue to be similar. Please note the omission of 2020 in the figure.

## Tables

Table 1. The season numbers, cumulative run time of the show, number of animals observed, and the total amount of time animals were observed on screen by filming year. The cumulative total across all years is presented in the final row.

Filming Year	Season #	Total Run Time (hrs)	Total Number of Animals Observed	Time Animals on Screen (sec)
2016	33/34	22.30	4,946	850
2017	35/36	22.45	3,236	664
2018	37/38	20.83	8,811	630
2019	39/40	25.35	12,349	588
2021	41/42	22.11	8,845	413
2022	43/44	22.32	6,602	347
2023	45/46	29.87	5,073	525
<b>7 years</b>	<b>14 seasons</b>	<b>165.23</b>	<b>49,862</b>	<b>4,017</b>

Table 2. Counts of all individual animals identified down to genus or species level. Individuals that could not be identified to the genus or species level are enumerated in the “count unidentified” column. The amount of time (in seconds) for each screen classification category and sub-category is provided for each animal by the type of footage captured.

Animal Category	Number of Taxa Identified	Count Identified	Count Unidentified	Total Screen Time (sec)	Transition Time (sec)	Interaction Time (sec)	Hunting Time (sec)	Background of Focus Time (sec)	Theme Song Time (sec)
<b>Amphibians</b>	<b>2</b>	<b>6</b>		<b>15</b>	<b>15</b>
